

LIVE PRODUCTION AUDIT · GROK MCP + SITE + WORKSPACE

LitigaForge — Problems and Fixes for Replit

Paste this brief into Replit Agent. Fix in listed order. Do not add features until P0 ships.

Tested 5 September 2026 against **litigaforge.com** and the connected Grok MCP (search / list recent / get judgment / country info). GitHub repo `arif806-cyber/litigaforge-ai` is a stub; apply these changes on the live Replit app (FastAPI under `/litigaforge/`, React SPA, Workspace SSE).

Priority map

P	Item	Why it blocks customers
P0	Judgment deep URLs render a generic page	MCP and Finder hand off to a dead URL. Grok → site loop is broken.
P0	MCP search_judgments is name-only	MACT / MV Act / delimitation queries return []. Lawyers will think the connector is empty.
P0	Workspace POST /analyze streams 0 bytes	Canvas “run agents” hangs. Core Workspace promise fails.
P1	Simulate SSE dies mid-token	What-if demo cuts off. Looks unfinished.
P1	Two search indexes (local DB vs Indian Kanoon)	MCP and Workspace disagree on the same query.
P1	Incomplete + duplicate judgment rows	AP Amaravati returned 3 near-identical Rahman slugs; outcomes often empty.
P2	Auth / onboarding friction	/signup 404, default Client tab, 15-min token, no Workspace preview.
P2	MCP has no Workspace tools	Do not advertise Workspace inside Grok until OAuth tools exist.

QA accounts already on production (delete after)

Role	Email	Password	IDs
Advocate	grok.qa.advocate.20260905@litigaforge.com	GrokQA!Workspace26	user 112 · session 12
Client	grok.qa.client.20260905@litigaforge.com	GrokQA!Workspace26	user 113 · session 13

Both free, email_verified=false, advocate is_verified=false, lawyer_status=null. Password login works. If_token Max-Age=900s. Session 12 title: “QA MACT research” already has a Bombay HC Millennium Beer canvas node.

P0-1 · Judgment deep pages

Problem. MCP returns `https://litigaforge.com/judgments/bombay-high-court/2026/commissioner-of-central-excise-v-millennium-beer-industries-ltd`. That path falls through to the generic “Legal Information” shell. Same for AP Amaravati Rahman slugs. Indian Kanoon source_url is the only working read path.

Fix in Replit

1. Add a React route that the catch-all must not swallow: `/judgments/:court/:year/:slug`.
2. Fetch the same record MCP uses (`court_slug + year + slug`).
3. Render case name, court, date, EN/HI summary, acts, outcome, IK source_url, and “Open in Workspace” (auth required).
4. If text is incomplete, show that badge and the IK link — never the marketing page.
5. Check Replit reverse proxy + SPA fallback actually pass this path to the app.

Done when the Bombay HC URL above shows Millennium Beer, not homepage copy.

P0-2 · MCP search_judgments

Problem. Live results on 5 Sep 2026:

Query	Hits
Millennium Beer	1 — correct Bombay HC case
MACT motor accident compensation hit and run	0
Motor Vehicles Act compensation	0
delimitation Census Act Andhra Pradesh	0 (AP list-recent is delimitation)
Krishan Kumar Punjab Mandi	0

Search behaves like a narrow party-name lookup, not summary / acts / outcome search.

Fix in Replit

In the FastAPI MCP tool `search_judgments`:

1. Full-text / ILIKE / tsvector across `case_name`, `summary`, `summary_en`, `outcome`, `acts_cited`, `slug`.
2. Rank: name match > act match > summary match.
3. Court filter must accept partial slugs (`ilike %andhra-pradesh%`).
4. If local DB returns 0 on a topical query, fallback to the same Indian Kanoon adapter Workspace already uses. Set `source_name` honestly (LitigaForge vs IndianKanoon).
5. Never return silent [] when `list_recent` clearly contains related text.

Done when MCP query “MACT Telangana” returns ≥3 hits including TSRTC / NIC-style accident cases.

P0-3 · Workspace /analyze SSE

Problem. POST `/litigaforge/workspace/sessions/12/analyze` with a MACT `case_description` timed out at 12s with 0 bytes. The UI will spin forever.

Fix in Replit

1. Send Content-Type: `text/event-stream` and flush data: `{"type":"start"}` immediately.
2. If model/API key is missing, emit an error event and close — do not hang.
3. try/except the LLM call; always terminate the stream.
4. Cap first-token wait at 8 seconds.
5. Log `session_id`, `user_id`, first-byte ms.

Done when curl analyze on session 12 prints an SSE line within 3 seconds.

P1-1 · Simulate stream drops

Problem. POST `.../simulate` emitted `sim_start`, `sim_before`, `risk + strategy` agents, then died mid-token: “Under Section 161 BNSS (erstwhile)”.

Fix. Same discipline as `analyze`: flush, 5s heartbeat, catch provider drop, send `sim_end` or error. If one agent fails, mark it failed and finish the others.

P1-2 · Unify search

Problem. MCP searches the local judgments table. Workspace POST `/workspace/sessions/{id}/search` searches Indian Kanoon (source: `indian_kanoon`) and **does** find Telangana MACT cases (TSRTC vs Vatterm Saroja 2026; NIC vs Thungala Dhana Laxmi 2026).

Fix. One shared function `search_case_law(query, court=None, limit=8)` used by MCP and Workspace. Local DB first; if fewer than 3 hits, IK fallback; merge and dedupe by `source_url` / IK id. Always return `source: local_db | indian_kanoon | merged`.

P1-3 · Incomplete and duplicate rows

Problem. Many MCP outcomes say the operative order is not discernible. `list_recent` for `andhra-pradesh-high-court-amravati + 2026` returned three near-identical Mohd Khalelur Rahman slugs (`...278690`, `...141481`, `...495958`).

Fix. Ingestor sets `text_complete=false` when outcome extraction fails and keeps `source_url`. Expose `text_complete` on UI + MCP. Dedupe on (`court_slug`, normalized name, date) or IK doc id. Keep one canonical slug; 301 the rest. Prefer storing full IK/court text before summarizing.

P2 · Auth, onboarding, MCP scope

Bug	Fix
/workspace logged-out is only a login wall	Show a 10s read-only demo canvas + CTA.
Login default tab is Client	If <code>?role=advocate</code> or <code>next=/workspace</code> , pre-select Advocate.
/signup is an in-app 404	Alias <code>/signup</code> → <code>/register</code> .
Open Forge Workspace from /judgments	Go to <code>/register?role=advocate&next=/workspace</code> if logged out.
Advocate lawyer_status is null after signup	Force <code>/lawyers/register</code> until city + practice areas exist.
lf_token Max-Age 900s	Refresh on Workspace heartbeat; 15 min kills long SSE.
Client can POST /workspace/sessions	Decide: advocates-only or client lite; enforce in API.
MCP has no canvas tools	Do not promise Workspace in Grok until OAuth tools exist.
citation field is usually null	Parse reporter cite from IK header when present.
get_judgment returns digest only	Add <code>full_text ≤20k</code> or <code>text_complete=false + source_url</code> .

Files / routes to touch on Replit

Production bundles already split Workspace (`workspace-Dr_aDjUJ.js`). Match live paths:

FastAPI /litigaforge/

- MCP: `search_judgments`, `get_judgment`, `list_recent_judgments`
- POST/GET `/workspace/sessions` · PUT `.../canvas`
- POST `.../search` · `.../smart-search`
- POST `.../analyze` · `.../simulate` (SSE)
- POST `.../insights` · GET `.../cross-matter`
- Judgment ingest + FTS index

React

- `/judgments/:court/:year/:slug` page
- `/workspace` gate + demo canvas
- `/login` and `/register` honor `?role=` & `?next=`
- redirect `/signup` → `/register`

QA checklist after deploy

```
# 1. Deep page must contain the case name
curl -s https://litigaforge.com/judgments/bombay-high-court/2026/commissioner-of-central-excise-v-millennium-beer-industri

# 2. Signup alias
curl -sI https://litigaforge.com/signup
# expect 302 → /register

# 3. Analyze must emit SSE within 8s (use advocate cookie)
curl -N --max-time 8 -b cookies.txt -H 'Content-Type: application/json' \
-X POST https://litigaforge.com/workspace/sessions/12/analyze \
-d '{"case_description":"Hit-and-run MACT Hyderabad"}'

# 4. MCP-equivalent search must not be empty
# "MACT Telangana" → ≥3 hits
```

5. Workspace search still finds TSRTC MACT via IK fallback

Out of scope this pass

New countries, new blog posts, new pricing tiers, paid ads for Workspace, or exposing Twin/canvas on MCP without OAuth. Ship P0 deep pages + P0 MCP FTS + P0 analyze SSE. That closes the Grok → site → Workspace loop tested tonight.

Replit Agent one-liner

“Read this PDF. Implement P0-1 judgment route, P0-2 full-text MCP search with IK fallback, and P0-3 analyze SSE flush/error. Then P1 simulate + shared search_case_law + dedupe. Then P2 /signup redirect, advocate default on Workspace CTA, token refresh. Verify with the curl checklist. Do not start new features.”

Generated from a live end-to-end test of Grok LitigaForge MCP, litigaforge.com Judgment Finder, /workspace login gate, /register, and authenticated Workspace APIs (sessions, canvas, search, insights, simulate, analyze).
